IIDD 2 FINAL COURSE PROJECT

Individual Web Portfolio for Industry & OJT Placement
Project Documentation

Course Code & Title:	IIDD 2 – Industrial Interface Design and Development 2
Project Name:	Altheorene A. Cruz – OJT Web Portfolio
Student Full Name:	Altheorene A. Cruz
Student ID:	2017100175
Program & Section:	BIT – Computer Technology, 4CG1
Instructor:	Vinna Ramos
Live Deployment URL:	https://altheorenecruz.github.io/ojt-portfolio/
Date of Submission:	November 6, 2026

Section 1: Developer Profile & Links

Target Industry Track / Role

UI/UX Web Designer

Live Deployment URL

Professional Elevator Pitch

I am a Computer Technology student at the College of Industrial Technology, Bulacan State University, and an aspiring UI/UX and front-end web designer. I design interfaces in Figma, build them with HTML, CSS, and JavaScript, and bring a background in networking, MySQL, and software troubleshooting. I am a fast learner who values teamwork, discipline, and accountability, and I am ready to help a partner company build usable web interfaces during my 500 training hours.

Cover Letter

November 6, 2026

The Hiring Manager
Human Resources Department

Dear Hiring Manager,

I am writing to apply for an On-the-Job Training position as a UI/UX Web Designer at your company. I am a Bachelor of Industrial Technology student majoring in Computer Technology at Bulacan State University – College of Industrial Technology, and I am required to render 500 training hours starting the 2nd Semester of A.Y. 2026–2027.

I focus on designing clear, simple interfaces and turning them into working web pages. My portfolio includes an IPv4 Subnet Calculator that makes subnetting visual with a color-coded binary view, a Computer Lab Reservation system with a weekly schedule grid that prevents double-booking, and the Student Violation and Record Monitoring System (SVMS), a role-based disciplinary records portal I am building for our college. Beyond design, I have experience with Java, MySQL, networking, and computer hardware.

I learn quickly, work well in a team, and take responsibility for my work. My portfolio, CV, and live project demos are available at https://altheorenecruz.github.io/ojt-portfolio/. Thank you for your time and consideration. I look forward to hearing from you.

Respectfully yours,

Altheorene A. Cruz

449 L. Valencia St., Sto. Rosario, City of Malolos, Bulacan

Section 2: Technology Stack & AI Tooling

1. Coding Environment & Core Stack

The portfolio uses semantic HTML5 (header, nav, main, section, article, footer) and CSS3 with Flexbox, CSS Grid, CSS custom properties for the color theme, and media queries for tablet and mobile. A vanilla JavaScript file runs the light/dark toggle, saves the choice in localStorage, and highlights the current section in the navigation. Both projects also use plain JavaScript. I used Visual Studio Code to review and edit files and Google Chrome DevTools to test screen sizes and check the Console for errors. The fonts are Sora for headings, Figtree for body text, and IBM Plex Mono for labels, loaded from Google Fonts.

2. AI & Vibe Coding Tools Used

I used Claude (Anthropic) through the Claude app as my main AI development tool, and I also use ChatGPT and GitHub Copilot in my studies. I chose Claude for this project because I could give it the full IIDD 2 guidelines, my photo, all of my details, and my design preferences in one prompt, and it produced the complete folder structure, tested the pages in a browser, and generated my CV.

3. Deployment Platform

I deployed on GitHub Pages because it is free, it is the recommended option in the guidelines, and it hosts directly from the public repository that holds my source code. The site is served from the *main* branch, root folder.

Section 3: Prompt Engineering Strategies & Iteration Log

1. Prompting Strategies Applied

Technique 1: Context-setting with design constraints

I gave the AI exact visual requirements up front instead of letting it choose: "royal blue and white are the color scheme i want", "minimal but modern", and "yes i want dark and light toggle". I also asked for a different concept from other portfolios. Because of this, the first version already used a royal blue and white palette, a minimal split layout, and a working theme switch.

Technique 2: Structured data in one prompt

I organized my information into labeled groups: name, role, contact details, study background, skills, tools (grouped as programming, databases, and design), hours, availability, links, and a short description of myself. I also attached my formal photo. This let the AI place each item in the correct section of the guidelines, such as putting Java, Python, and C++ under programming and MySQL and Workbench under databases.

2. Prompt Iteration Log

Instance A (Layout / Component Issue)

Initial Prompt Given:

> *"make me this but in different concept again and in guidelines and new 2 projects" together with my details, color scheme, toggle request, links, and photo.*

Flaw in AI Output: In the first version, the direct channels under my name showed the links as "GitHub", "LinkedIn", and just the word "Email". The guidelines require the email address itself to be visible in the hero, so a recruiter could not see or copy my address without clicking.

Corrective Follow-Up Prompt / Strategy Used:

> *"In the hero, show my full email address instead of the word Email, and make sure it wraps on small screens."*

The AI replaced the label with altheorenecruz0912@gmail.com, placed it on its own line under the GitHub and LinkedIn links, and added *overflow-wrap: anywhere* so it does not overflow the narrow side panel.

Instance B (Styling / Behavioral Issue)

Initial Prompt Given:

> *Same prompt as Instance A. My "(OBJECTIVES)" line was left empty, and I listed two different roles: "Junior Associate COMPUTER TECHNOLOGY" and "UI/UX Web Designer". I did not give a preferred OJT location.*

Flaw in AI Output: The AI filled these gaps on its own. It chose "UI/UX Web Designer" as my role, wrote an objective for my CV from my self-description, and set my preferred setup to "Malolos, Bulacan / Metro Manila / Remote". These appeared on the page as confirmed facts even though I had not provided them.

Corrective Follow-Up Prompt / Strategy Used:

> *"Keep UI/UX Web Designer as my role. Confirm the objective and preferred location with me, and explain how the subnet calculator and lab reservation code work so I can explain them."*

I reviewed each assumed value before keeping it, and asked for explanations of both projects so I understand the code I am submitting.

Section 4: Real Bottlenecks & Practical Problem-Solving

Bottleneck 1: Layout & Mobile View Quirks

My portfolio uses a split layout: a fixed profile panel on the left and scrolling content on the right. This works on a laptop, but on a tablet or phone the side panel would take most of the screen and squeeze the content. The fix was a media query below 1024px that stacks the profile panel on top, makes it scroll normally, and centers the navigation. Below 640px the metrics, competencies, skill rows, projects, and contact cards all switch to one column, and my long LinkedIn link and email wrap with *overflow-wrap: anywhere*. I tested at 390px, 820px, and 1280px widths in DevTools and confirmed there was no horizontal scrolling. When I opened the live site on my iPhone through Messenger's in-app browser, it loaded in dark mode automatically because the site follows the phone's theme setting, and the Light/Dark button switched it correctly. I also noticed that on a phone the stacked profile panel fills the whole first screen, so visitors see my photo, role, training hours, and CV button first and scroll down to reach the About, Skills, and Projects sections.

Bottleneck 2: Live Deployment / Asset Loading Issues

Because GitHub Pages serves the site under */ojt-portfolio/*, every stylesheet, script, image, CV, and project link uses a relative path such as *assets/css/style.css*. GitHub Pages also has to be enabled in Settings → Pages (Deploy from a branch, *main*, */ (root)*) before the URL works. The dark mode choice is saved in the browser with localStorage, so I checked that the toggle still remembers the theme after refreshing the live site.

Uploading to GitHub caused three real problems. First, I selected the files with the file picker, which uploaded everything loose without folders and created duplicates like *index (2).html* and *style (1).css*, so the page loaded with no design. I deleted the repository and tried again, but this time I dragged the outer *Cruz_Altheorene_IIDD2_Final* folder itself, which put *index.html* one level too deep. On the third attempt I opened the folder, selected everything inside it with Ctrl+A, and dragged those items in, which kept the *assets* and *projects* folders correct. Finally, after Pages was enabled, the photo loaded but the page was still unstyled because my browser had cached the broken version. Opening the site in an Incognito window confirmed the stylesheet was working, and the full design appeared.

Bottleneck 3: Working with AI-Generated Code

The hardest part was understanding the subnet calculator's logic well enough to defend it. IP addresses are converted into 32-bit numbers, and the network address is found by removing the host bits. Special cases also have to be handled: a /31 network has two usable addresses for point-to-point links, and a /32 is a single host. I tested the calculator with known answers from our networking class, such as 192.168.10.75/26 giving a network of 192.168.10.64 and 62 usable hosts. For the lab reservation, I tested booking a slot, trying to book a taken slot, and cancelling my own reservation.

Section 5: Experience Reflection & OJT Readiness

1. Human vs. AI Roles

The AI was best at turning my scattered notes into an organized site that follows the guidelines, and at building consistent light and dark themes from one color scheme. It struggled with information only I could give: it had to guess my objective, role, and preferred location, and it missed the guideline detail about showing my email address. Choosing my design direction, confirming my details, deploying to GitHub Pages, and testing on my own devices required my own work.

2. OJT Industry Readiness

The Featured Projects section best shows my readiness. The Student Violation and Record Monitoring System is a live, role-based portal built for real users in our college. The Computer Lab Reservation shows that I can design a practical interface around real users and rules, like class schedules and double-booking. The IPv4 Subnet Calculator shows that I can combine my networking knowledge with front-end development and present technical information in a way that is easy to understand.

3. Future Upgrades

Before sending my portfolio to companies, I plan to finish the Student Violation and Record Monitoring System, replace its cover image with real screenshots of the dashboards, and add my Figma wireframes for it. I also want to connect the lab reservation system to a MySQL database so bookings are shared between users.
